

Experiment with Bahrain Fiber Optic Displacement Sensor

Fiber optic displacement sensor using multimode fiber coupler based on intensity modulation has been demonstrated. In general, both theoretical and experimental results agree each other.

Sensor design for large shear-sliding displacement measurements with optical fiber is presented.

In this paper a quasi-distributed fiber-optic displacement sensor (QDFODS) for landslide monitoring using an optical time domain reflectometer (OTDR) was demonstrated.

"This gives us a new way to read out fiber-optic sensor signals without relying on conventional optical-spectrum interrogation, while still exploiting the rich modal behavior of polymer ...

Our paper begins by describing the mathematical model that underlies advanced sensor configurations. We then explain our method for designing the fiber bundles and critically analyze the ...

The sensor achieves a sensitivity of 1.7 mV/mm using a 50:50 coupler with aluminum. Maximum linear range is 1.5 mm with over 99% linearity when using red He-Ne laser. The sensor demonstrates a ...

Here, we present a comprehensive analytical model for multi-axis tilt sensing based on intensity-modulated optical fiber sensors (OFDSs).

fiber based sensors are also presented in this chapter. The application of the FODSs in liquid refractive index measurement is investigated theoretically and experimentally. In the last part of this chapter, a ...

This article reviews specifically the advanced fiber optic displacement sensing techniques that have been developed in the past two decades.

A critical aspect of OFDS performance is the geometry of the fiber bundle, which influences key parameters such as sensitivity, range, and dead zones. In this work, we present a ...
