

A fibre bundle or fiber bundle is a bundle in which every fibre is isomorphic, in some coherent way, to a standard fibre or typical fiber. Usually one also requires that it be locally trivial, ...

Fiber bundles and fibrations encode topological and geometric information about the spaces over which they are defined. Here are but a few observations on their impact in mathematics.

Principal fiber bundles are a fundamental tool in differential geometry and global analysis, where they provide the language for understanding curvature and for studying the interplay between geometry, ...

\mathcal{L} derived from the Liouville form acting on logarithmic differential forms, and give an exactness criterion. We use this Liouville complex to connect properties of the D-module generated by f_s to homological ...

Fiber bundles are not always used to generalize functions. Sometimes they are convenient descriptions of interesting manifolds. A common example in geometric topology is a torus bundle on ...

In this section we prove some basic properties of N -fiber-full modules, in order to show the equivalence between being N -fiber-full up to h and the flatness of modules $\text{Ext}^i_A(M, N)$ with $i \leq h-1$.

Through local cohomology, we connect the cohomology of the Milnor fiber to the Jacobian module via logarithmic differentials.

E MILNOR FIBER, AND THE D-MODULE GENERATED BY f_s ULI WALTHER Abstract. For a germ f on a complex manifold X , we introduce a complex derived from the Liouville form ω .

Fiber bundles, such as the tangent bundle of a manifold and other more general vector bundles, play an important role in differential geometry and differential topology, as do principal bundles.

We provide a local criterion characterizing the B -freeness of all the local cohomology modules $(H_{\mathfrak{m}}^i(M))$ of a finitely generated graded R -module M . We show that fiber-full ...

A fiber bundle has the homotopy lifting property with respect to all CW complexes (i.e., it is a Serre fibration). Moreover, fiber bundles over paracompact spaces are fibrations.

In lecture I gave some examples of fiber bundles and one example of a non-fiber bundle. As your texts does not cover this material I'm recording formal definitions and some elementary properties here.

After a brief introduction to the concept of gauge invariance and its relationship to determinism in Section 2, we introduce in Chapters 3 and 4 the notion of fibre bundles in the context of a discussion on ...
