

A beam splitter is defined as an optical device that effects a linear transformation of fields presented at two input ports, producing output beams that are related to the input fields in a characteristic manner ...

We know that it must contain exactly two photons, because the beam splitter transformation conserves energy and there are exactly two photons present at its input.

When discussing two packets that arrive simultaneously at the input ports 1 and 2 of a beam-splitter, we envision identical packets whose leading edges arrive simultaneously at the entrance ports.

probabilities add themselves up. In case of a symmetric beam splitter, we can visualise the possible paths that the two photons can take (see Fig. 14). The two photons, here labelled in green and red ...

The elements of the beam splitter transformation matrix B are determined using the assumption that the beamsplitter is lossless. While a beamsplitter is never lossless, it is a good approximation for most ...

The behavior of the beam splitter is core to the presence and reduction of noise due to vacuum fluctuations in LIGO, which injects a squeezed vacuum state into the empty input port of the ...

Broadband beam splitters are offered, but with greater variation in the split ratio with respect to input polarization. Splitters that only split off a small portion of the input light are commonly known as taps. ...

When more than one photon is incident on a beam splitter, the fascinating effects of quantum interference come into play, creating unexpected outputs for simple inputs.

We will study the quantum mechanical analysis of how the beam splitter behaves under different input conditions such as pairs of photons incident on the two input arms which leads to two ...

More precisely, a beamsplitter contains two input ports and two output ports. Thus, consider two classical fields, with the same polarization and same frequency, entering the two input ports of a ...

Beam-splitter state is a quantum state produced by applying a two-mode $SU(2)$ unitary operation on inputs, yielding entangled and coherent outputs. They are characterized using binomial ...
