

A patented design allows for easy field installation of sensors and network nodes with MaxLite controls ready fixtures. Our c-Max Network Controls can easily scale small to large ...

ETC lighting systems have traditionally used flat, isolated networks with dedicated network hardware and cabling that are separate from corporate intranets and the outside world. This is the preferred ...

If task lighting and the ambient lighting are controlled separately, there is a potential for deeper savings and higher user acceptance. LED source luminaires offer a higher degree of control, and therefore ...

To create a high-performance, reliable, and user-friendly modern lighting system, its success hinges on the synergistic work of two pillars: a robust power supply system and intelligent sensing & control ...

By establishing a digital communication network between connected devices, nLight creates a system that helps meet code and the demand for greater functionality while aiding in reducing energy ...

This group of devices can perfect the lighting levels in different environments by adjusting the system based on the presence of occupants or on different distribution of the light within the environment itself.

Lighting network with two PCRs and two studios. The network is divided into four areas (PCR 1, PCR 2, Studio 1, Studio 2. which are connected to each other redundantly. Within the network areas, further ...

Lighting controls have evolved in response to wireless and addressable lighting fixtures. Programming lighting controls can be done over wired low-voltage, such as CAT-5E cabling or with ...

Electrical engineers must consider important design features when designing networked lighting controls. These include its key topologies, components, configurations, and operational protocols.

Networks in lighting control systems can be connected in different ways, especially in a wireless system. One of the more prevalent patterns is a "self-healing mesh network".
