

# What is the function of an optocoupler communication module

Optocouplers, also known as opto-isolators or photocouplers, are components that transmit electrical signals using light while providing complete galvanic isolation between circuits.

The major function of an optocoupler is to prevent high voltages or rapidly changing voltages on one side of the circuit from damaging components or distorting transmissions on the ...

An optocoupler, also known as an optoisolator or photocoupler, is an electronic component that transfers electrical signals between two isolated circuits by using light.

An optocoupler (also called an opto-isolator, photo-coupler, or optical isolator) is a solid-state semiconductor device that transfers electrical signals between two isolated circuits using optical ...

Unlike transformers or capacitors, which can only transfer AC signals across the isolation barrier, optocouplers can transfer both DC and AC signals alike. This makes them very popular in ...

An optocoupler (or opto-isolator) is a component that transfer signals between circuits using light. In this guide, you'll learn how they work and how you can use one in your own projects.

An Optocoupler (also known as Optoisolator and Photocoupler) transfers electrical signals between two isolated circuits by using light.

These components are called optocouplers or optoisolators or simply optos, and they perform the crucial function of passing signals between isolated sections of circuitry.

An opto-isolator (also called an optocoupler, photocoupler, or optical isolator) is an electronic component that transfers electrical signals between two isolated circuits by using light. Opto-isolators prevent ...

Optocoupler or optoisolator is an electronic component that is used to conduct the electrical signals from one circuit to another circuit without directly connected between them.
